

# Metal Protective Coating

**Iron, copper, aluminium, steel anti-  
corrosion treatment**

Permanent solvent-deposited coating to protect indoor and outdoor metal surfaces against corrosion. When cured, the coating is not sticky, hence ideal for cables, equipment and tools that will be handled after the application. May be removed by rubbing with a solvent degreaser, such as Dislodge.

## Directions for use:

### Dilution:

Dilution is not required.

1. Remove any moisture from the surface to be protected. Cyndan Moisture Stripper is ideal for this.
2. Shake well before use.
3. Apply by spray, dip or brush, ensuring the surface is completely covered.
4. Allow coating to dry and cure. Curing time will vary with climatic conditions; 20 minutes is normally adequate. When dry, a waxy residue is left.
5. To remove the coating, clean with a solvent degreaser.

**Note:** We recommend that the coating is not applied when there is moisture in the air or likely to be in the air during the drying time.
